# Machine Learning

Lecture 3
Types of Learning

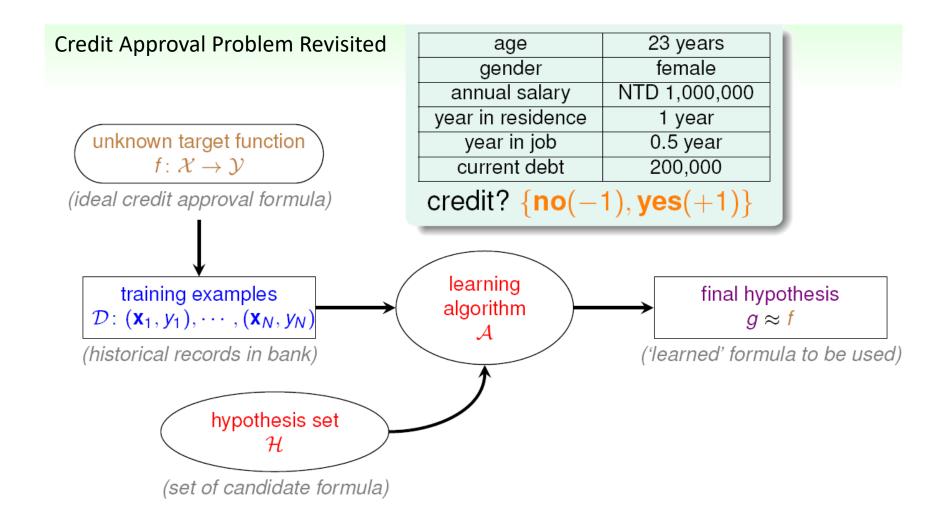

Chen-Kuo Chiang (江 振 國) ckchiang@cs.ccu.edu.tw

中正大學 資訊工程學系

# Types of Learning (機器學習的四種分類)

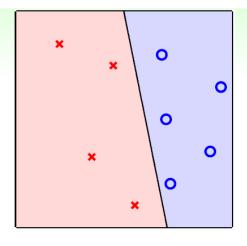

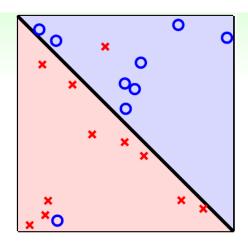

# Learning with Different Output Space Y:

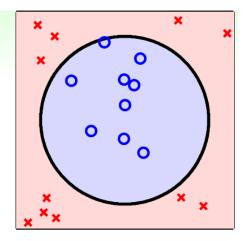

$$\mathcal{Y} = \{-1, +1\}$$
: binary classification

### More Binary Classification Problems

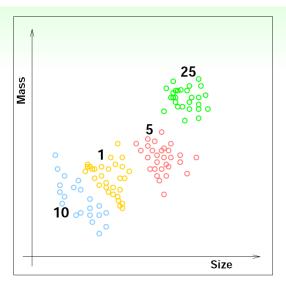

- credit approve/disapprove
- email spam/non-spam
- patient sick/not sick
- ad profitable/not profitable
- answer correct/incorrect (KDDCup 2010)

core and important problem with many tools as building block of other tools

# Multiclass Classification: Coin Recognition Problem

- classify US coins (1c, 5c, 10c, 25c)
   by (size, mass)
- $\mathcal{Y} = \{1c, 5c, 10c, 25c\}$ , or  $\mathcal{Y} = \{1, 2, \dots, K\}$  (abstractly)
- binary classification: special case with K = 2

#### Other Multiclass Classification Problems

- written digits  $\Rightarrow 0, 1, \dots, 9$
- pictures ⇒ apple, orange, strawberry
- emails ⇒ spam, primary, social, promotion, update (Google)

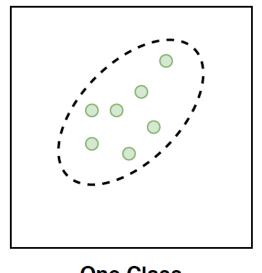

many applications in practice, especially for 'recognition'

### One-Class Classification (OCC)

適合大部分資料屬於某一類,僅需標記那類資料即可

- OCC is a special case of multi-class classification, where data observed during training is from a single positive class.
- The goal of OCC is to learn a representation and/or a classifier that enables recognition of positively labeled queries during inference.
- Application : Anomaly Detection

Multi-class Classification

One Class
Classification

v.s. binary-class 需要兩類都標記,準確會比單一標記(oneclass)還來得好,因為標得比較多,且這種 比較偏向兩類資料差不多數量)

### Regression: Patient Recovery Prediction Problem

- binary classification: patient features ⇒ sick or not
- multiclass classification: patient features ⇒ which type of cancer
- regression: patient features ⇒ how many days before recovery
- $\mathcal{Y} = \mathbb{R}$  or  $\mathcal{Y} = [lower, upper] \subset \mathbb{R}$  (bounded regression) —deeply studied in statistics

#### Other Regression Problems

- company data ⇒ stock price
- climate data ⇒ temperature

also core and important with many 'statistical' tools as building block of other tools

# Structured Learning: Sequence Tagging Problem

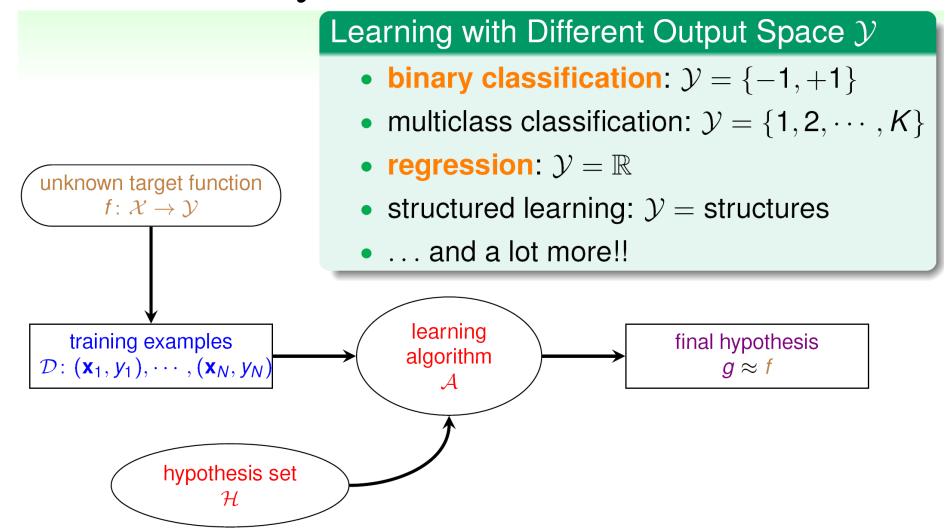

- multiclass classification: word ⇒ word class
- structured learning:
   sentence ⇒ structure (class of each word)
- $\mathcal{Y} = \{PVN, PVP, NVN, PV, \dots\}$ , not including VVVVV
- huge multiclass classification problem (structure = hyperclass) without 'explicit' class definition

#### Other Structured Learning Problems

- protein data ⇒ protein folding
- speech data ⇒ speech parse tree

a fancy but complicated learning problem

### Mini Summary

core tools: binary classification and regression

#### Fun Time

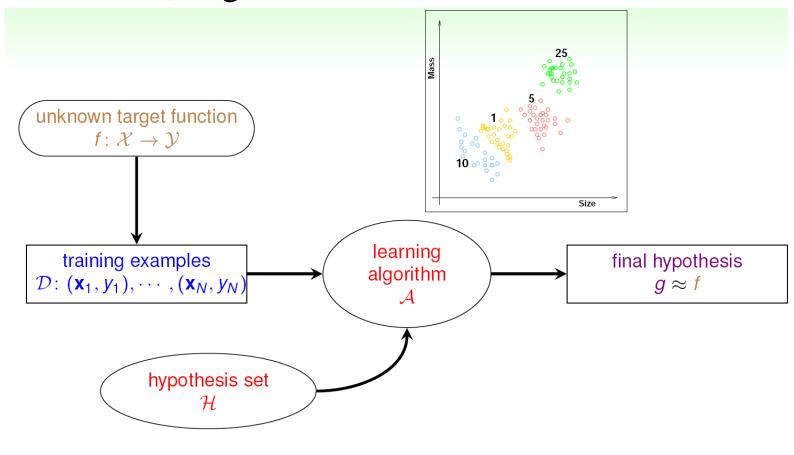

#### What is this learning problem?

The entrance system of the school gym, which does automatic face recognition based on machine learning, is built to charge four different groups of users differently: Staff, Student, Professor, Other. What type of learning problem best fits the need of the system?

- binary classification
- multiclass classification
- g regression
- 4 structured learning

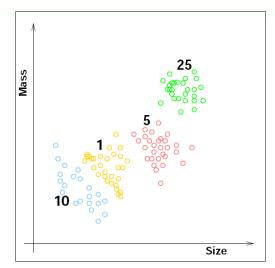

# Learning with Different Ways of Data Labeling

• Supervised: Coin Recognition Revisited

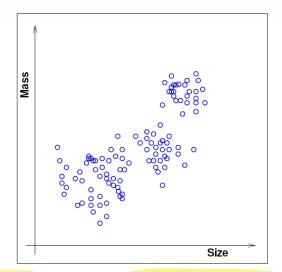

supervised learning: every  $\mathbf{x}_n$  comes with corresponding  $y_n$ 

# Unsupervised: Coin Recognition without $y_n$

supervised multiclass classification

unsupervised multiclass classification

⇔ 'clustering'

#### Other Clustering Problems

- articles ⇒ topics
- consumer profiles ⇒ consumer groups

clustering: a challenging but useful problem

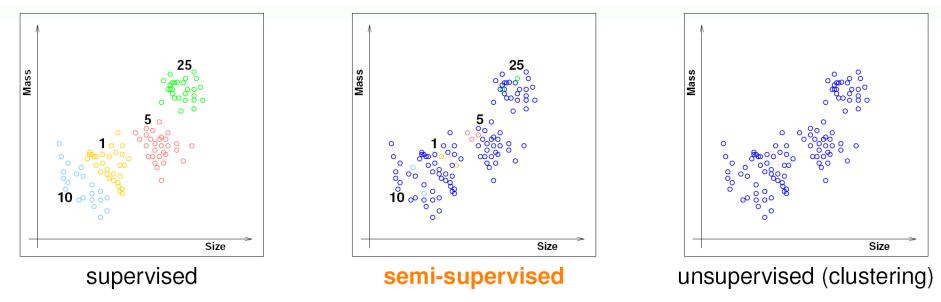

# Unsupervised: Learning without $y_n$

#### Other Unsupervised Learning Problems

- clustering: {x<sub>n</sub>} ⇒ cluster(x)
   (≈ 'unsupervised multiclass classification')
   —i.e. articles ⇒ topics
- density estimation: {x<sub>n</sub>} ⇒ density(x)
   (≈ 'unsupervised bounded regression')
   —i.e. traffic reports with location ⇒ dangerous areas
- outlier detection: {x<sub>n</sub>} ⇒ unusual(x)
   (≈ extreme 'unsupervised binary classification')
   —i.e. Internet logs ⇒ intrusion alert
- ... and a lot more!!

unsupervised learning: diverse, with possibly very different performance goals

# Semi-supervised: Coin Recognition with Some $y_n$

#### Other Semi-supervised Learning Problems

- face images with a few labeled ⇒ face identifier (Facebook)
- medicine data with a few labeled ⇒ medicine effect predictor

semi-supervised learning: leverage unlabeled data to avoid 'expensive' labeling

# Reinforcement Learning

#### Teach Your Dog: Say 'Sit Down'

The dog pees on the ground.

#### BAD DOG. THAT'S A VERY WRONG ACTION.

- cannot easily show the dog that  $y_n = sit$  when  $\mathbf{x}_n = sit$  'sit down'
- but can 'punish' to say  $\tilde{y}_n$  = pee is wrong

#### Teach Your Dog: Say 'Sit Down'

The dog sits down.

Good Dog. Let me give you some cookies.

- still cannot show  $y_n = sit$  when  $\mathbf{x}_n = sit$  down'
- but can 'reward' to say  $\tilde{y}_n = \sin i \sin good$

## Reinforcement Learning

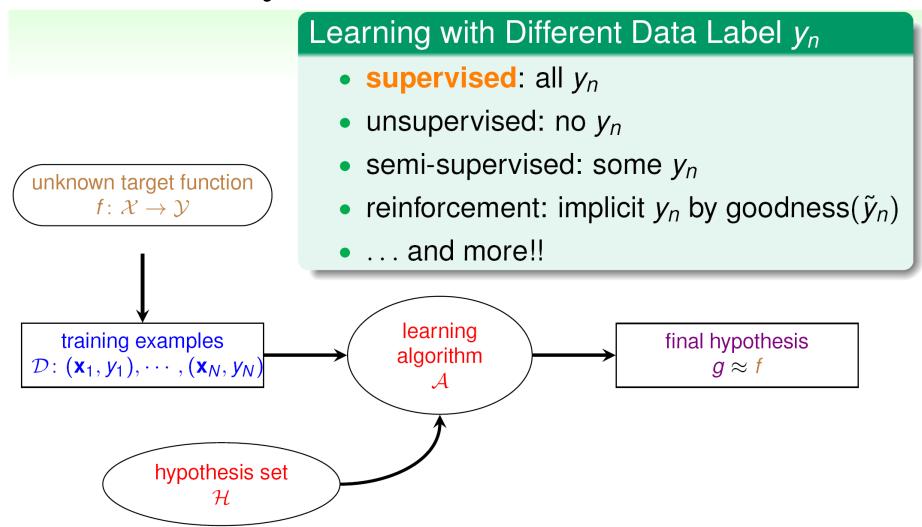

• A 'very different' but natural way of learning

#### Other Reinforcement Learning Problems Using $(\mathbf{x}, \tilde{\mathbf{y}}, \text{goodness})$

- (customer, ad choice, ad click earning) ⇒ ad system
- (cards, strategy, winning amount) ⇒ black jack agent

reinforcement: learn with 'partial/implicit information' (often sequentially)

## Mini Summary

core tool: supervised learning

#### Fun Time

• What is the most likely relationships among supervised, unsupervised, semi-supervised methods?

- ① Unsupervised > Semi-supervised > Supervised
- ② Unsupervised > Supervised > Semi-supervised
- Supervised > Unsupervised > Semi-supervised
- 4 Supervised > Semi-supervised > Unsupervised

#### Fun Time

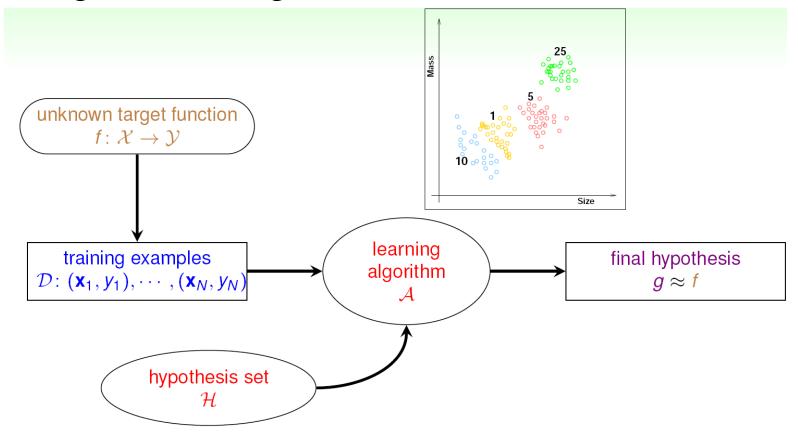

#### What is this learning problem?

To build a tree recognition system, a company decides to gather one million of pictures on the Internet. Then, it asks each of the 10 company members to view 100 pictures and record whether each picture contains a tree. The pictures and records are then fed to a learning algorithm to build the system. What type of learning problem does the algorithm need to solve?

- supervised
- 2 unsupervised
- semi-supervised
  - 4 reinforcement

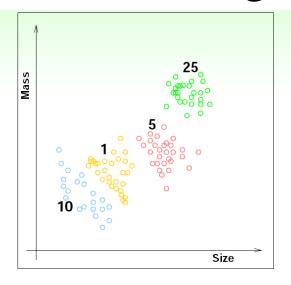

### Learning with Different Protocol

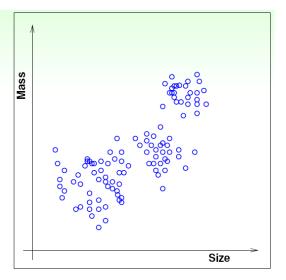

• Batch Learning: Coin Recognition Revisited

batch supervised multiclass classification: learn from all known data

# More Batch Learning Problems

- batch of (email, spam?) ⇒ spam filter
- batch of (patient, cancer) ⇒ cancer classifier
- batch of patient data ⇒ group of patients

batch learning: a very common protocol

# Online: Spam Filter that 'Improves'

- batch spam filter:
   learn with known (email, spam?) pairs, and predict with fixed g
- online spam filter, which sequentially:
  - $\mathbf{0}$  observe an email  $\mathbf{x}_t$
  - 2 predict spam status with current  $g_t(\mathbf{x}_t)$
  - 3 receive 'desired label'  $y_t$  from user, and then update  $g_t$  with  $(\mathbf{x}_t, y_t)$

#### Connection to What We Have Learned

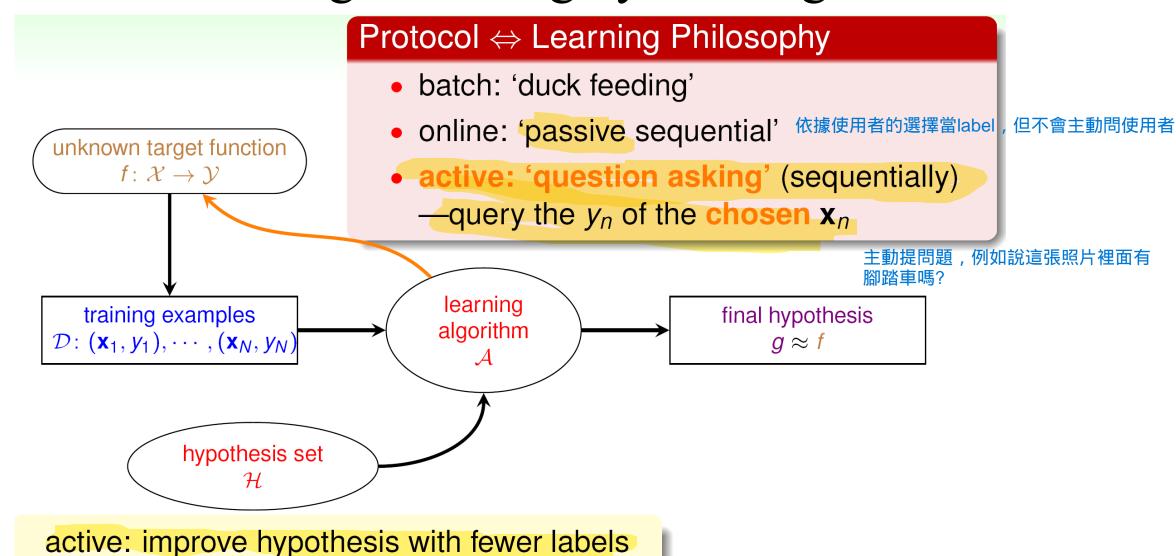

reinforcement learning is often done online (why?)

online: hypothesis 'improves' through receiving data instances sequentially

隨時間improve

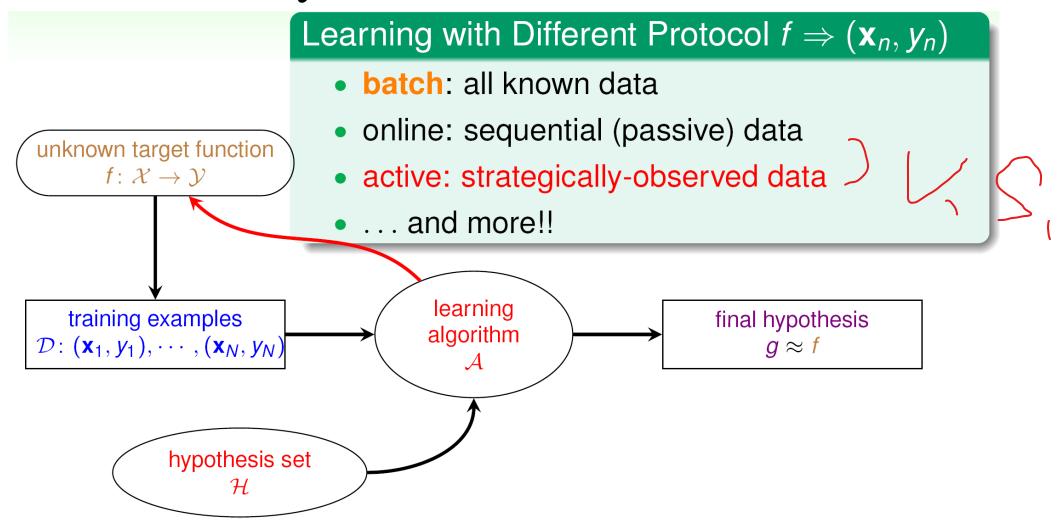

# Active Learning: Learning by 'Asking'

(hopefully) by asking questions strategically

23

#### Mini Summary

core protocol: batch

#### Fun Time

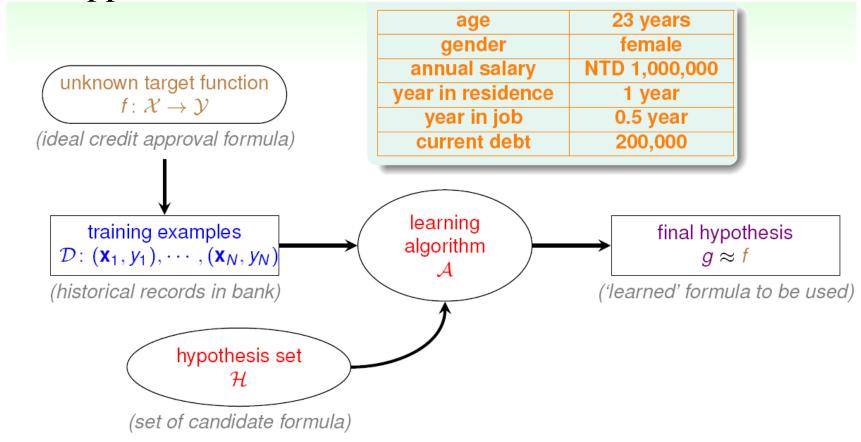

#### What is this learning problem?

A photographer has 100,000 pictures, each containing one baseball player. He wants to automatically categorize the pictures by its player inside. He starts by categorizing 1,000 pictures by himself, and then writes an algorithm that tries to categorize the other pictures if it is 'confident' on the category while pausing for (& learning from) human input if not. What protocol best describes the nature of the algorithm?

- batch
- online
- 3 active
  - 4 random

# Learning with Different Input Space X

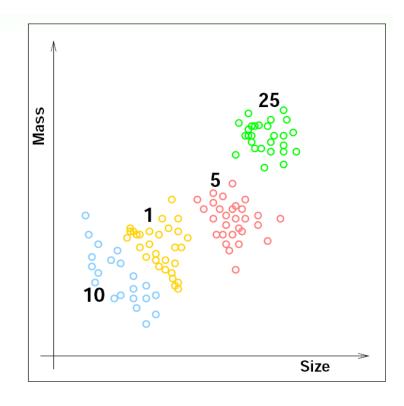

Credit Approval Problem Revisited

concrete features: each dimension of  $\mathcal{X} \subseteq \mathbb{R}^d$  represents 'sophisticated physical meaning'

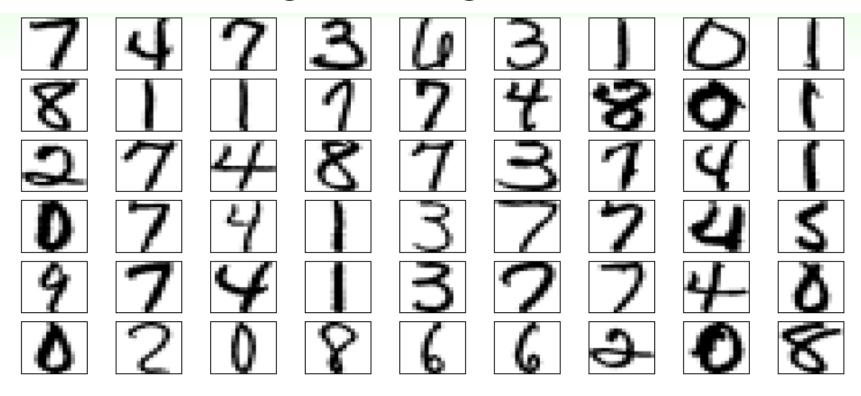

#### More on Concrete Features

- (size, mass) for coin classification
- customer info for credit approval
- patient info for cancer diagnosis
- often including 'human intelligence' on the learning task

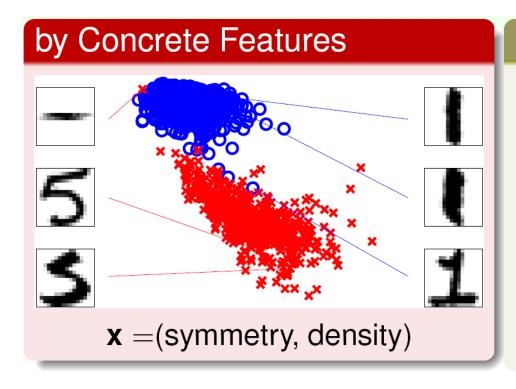

concrete features: the 'easy' ones for ML

# Raw Features: Digit Recognition Problem (1/2)

- digit recognition problem: features ⇒ meaning of digit
- a typical supervised multiclass classification problem

# Raw Features: Digit Recognition Problem (2/2)

#### by Raw Features

- 16 by 16 gray image  $\mathbf{x} \equiv (0, 0, 0.9, 0.6, \cdots) \in \mathbb{R}^{256}$
- 'simple physical meaning'; thus more difficult for ML than concrete features

#### Other Problems with Raw Features

image pixels, speech signal, etc.

raw features: often need human or machines to convert to concrete ones

### Abstract Features: Rating Prediction Problem

#### Rating Prediction Problem (KDDCup 2011)

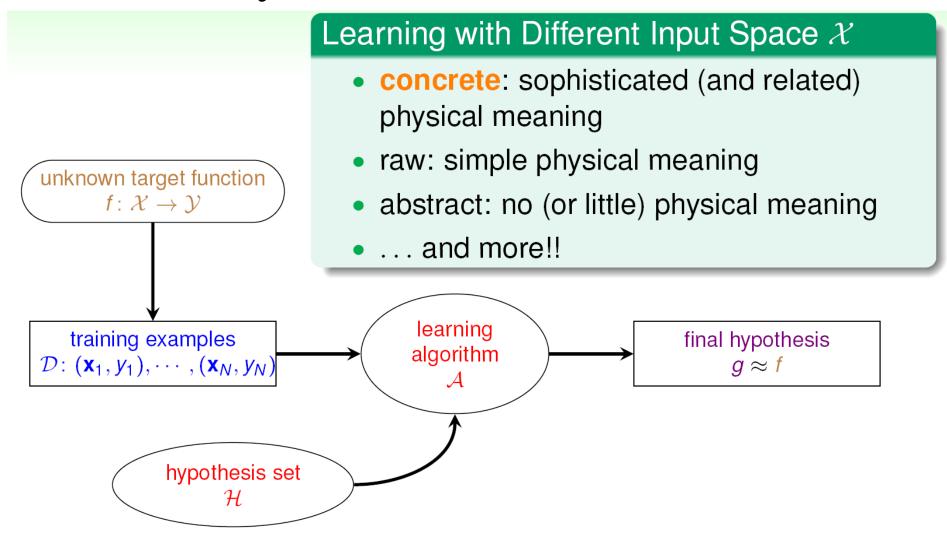

- given previous (userid, itemid, rating) tuples, predict the rating that some userid would give to itemid?
- a regression problem with  $\mathcal{Y} \subseteq \mathbb{R}$  as rating and  $\mathcal{X} \subseteq \mathbb{N} \times \mathbb{N}$  as (userid, itemid)
- 'no physical meaning'; thus even more difficult for ML

#### Other Problems with Abstract Features

- student ID in online tutoring system (KDDCup 2010)
- advertisement ID in online ad system

abstract: again need 'feature conversion/extraction/construction'

### Mini Summary

'easy' input: concrete

31

# Other Methods of Machine Learning

#### • Multi-Label Classification 多輸出

• In this task, we try to predict 0 or more classes for each input example. In this case, there is no mutual exclusion because the input example can have more than one label.

#### Multi-Instance Learning

• A supervised learning problem where individual examples are unlabeled; instead, bags or groups of samples are labeled.

#### Multi-Task Learning

• A type of supervised learning that involves fitting a model on one dataset that addresses multiple related problems.

# Other Methods of Machine Learning (con't)

#### Self-Supervised Learning

• Self-supervised learning refers to an unsupervised learning problem that is framed as a supervised learning problem in order to apply supervised learning algorithms to solve it.

#### Transfer Learning

• A type of learning where a model is first trained on one task, then some or all of the model is trained/used as the starting point for a related task.

#### Ensemble Learning

- Ensemble learning is an approach where two or more modes are fit on the same data and the predictions from each model are combined.
- Few Shot Learning / One Shot Learning / Zero Shot Learning

# Other Terms from Deep Learning

- Contrastive Learning
- Adversarial Learning
- Meta Learning
- Lifelong Learning / Continuous Learning / Never Ending Learning / Incremental Learning
- Green Learning

### Summary

Types of Learning

```
    Learning with Different Output Space y

          [classification], [regression], structured

    Learning with Different Data Label yn

[supervised], un/semi-supervised, reinforcement
  • Learning with Different Protocol f \Rightarrow (\mathbf{x}_n, y_n)
                               [batch], online, active

    Learning with Different Input Space X

                            [concrete], raw, abstract
```
